

## CONCEPT

IBI Group in collaboration with PCL Agile presents a schematic design which seeks to celebrate the pedestrian experience along King Street. The parklet is comprised of interlocking hexagonal modules extruded at varying heights to accommodate a multitude of programs. The underlying grid system provides an organizing element that allows for adaptability in the design through height, position, and materiality. During the day, it is a place for pedestrians to relax or tourists to visit, and by sundown it becomes an ambient meeting point catering to Toronto's vibrant nightlife. The use of interactive lighting effects will be used to animate the streetscape, particularly at night.
